

ABSTRACT

A bridging adapter connects a wireless phone to a standard telephone line network to allow land-line based telephone system within structures to translate command functions and audio signals between the wireless phone and any land-line telephones on the phone line network. The bridging adapter may also be used with extendable multi-handset systems where multiple handsets communicate over radio frequencies with a base station. The bridging adapter allows land-line telephones or handsets to access all functions and services of a wireless phone connected to the adapter, and conversely allow the wireless phone to use the unique functions of a land-line based telephony network.
